Burn ICU Case Study: Marcus Delaney, a Three-Day ICU Stay, Shift by Shift

Critical Care / Advanced Med-Surg | Individual take-home clinical care-plan case study | Open book

Your patient

You are the Burn ICU nurse for Marcus Delaney, a 34-year-old man in room BICU-6 with burns from a house fire. Open the patient in the student EHR (Student View, or the patient file from your instructor). He arrived in the ICU at 0400 on Monday 11/02/26 and the night nurse has cared for him since. You take over at the 0700 shift change, and the chart runs until his transfer to a medical-surgical unit on Thursday 11/05/26 at 0700.

You will work through his stay one 12-hour shift at a time. At the start of each shift, set the simulation clock to the time written at the top of that shift and read the chart up to that moment. You may not need to look past the end of the shift you are working on. Each question tells you where to look in the EHR.

The six shifts

Shift 1: Monday 11/02, 0700 to 1900 (day). Shift 2: Monday 1900 to Tuesday 11/03 0700 (night). Shift 3: Tuesday 0700 to 1900 (day).

Shift 4: Tuesday 1900 to Wednesday 11/04 0700 (night). Shift 5: Wednesday 0700 to 1900 (day). Shift 6: Wednesday 1900 to Thursday 11/05 0700 (night, ends with transfer to Med-Surg).

How this case study works

Each numbered question is a real nursing decision or a piece of reasoning you would do on the unit: reading the flowsheets, labs, orders, MAR and notes, doing the math, and explaining what you would do and why. Write your answer in the large box under each question. Short, specific answers that use Marcus's own numbers earn more points than general textbook answers.

Expect to spend about one hour on each shift, six hours in all. It is a take-home, individual, open-book assignment: use your textbooks, drug guide, notes and the chart.

Scoring

- The whole case study is worth 100 points. A score of 78 or higher is passing.
- Each numbered question shows its point value. Points are given only for what is written in the box.

Writing and turning it in (your pages will be scanned)

- Write in dark pen or very dark pencil, print clearly, and stay inside the box. Write the answer in the box with the same number as the question.
- Write your name and date at the top of every page (the header prints a line for it).
- If you need more room, write "continued on the back" and put the question number on the back.
- Spell out drug names. Show your math: write the formula, the numbers and the units.
- Do not take photos of your work. Your instructor will scan it.
- TURN-IN: put ALL the pages in order and fasten them with a PAPERCLIP. Do NOT staple (the pages must come apart to be scanned). Leave the packet in the instructor's cubby at office G218i.

Honor statement: I completed this work myself, using only my textbooks, notes, drug references and the patient chart.

Signature: _____ Date: _____

PART 1: SHIFT 1: MONDAY 11/02, 0700 TO 1900 (DAY SHIFT)

Nursing process step: Day 1 of the stay | About 60 minutes | 20 points

Set the simulation clock to 0700 on Monday 11/02/26 and move it forward as you work. Marcus arrived in the ICU at 0400; you take report from the night nurse and care for him until you hand off at 1900. You can read everything charted before 0700, and the chart fills in as the clock moves forward.

1.1 Why Is He Here? Your Picture of Marcus at 0700 *(2.5 pts)*

Set the clock to 0700. You are taking report from the night nurse. Read the ED Provider Note, the Burn Surgery and Critical Care H&Ps, the nursing notes from 0425 to 0650 and the Patient Summary. In your own words, explain what happened to Marcus, what injuries he has and what has already been done, then name the THREE most urgent problems you must manage over the next 12 hours.

Where to look in the EHR: Patient Summary; Chart Review > Notes (ED Provider Note, Burn Surgery H&P, Critical Care H&P, Nursing Admission Note)

1.2 The Parkland Formula *(2 pts)*

Find the burn size and his weight in the chart. (a) Calculate his total 24-hour fluid need with the Parkland formula. (b) How much must he receive in the FIRST 8 hours, and by what clock time does that period end? (c) EMS gave 500 mL of lactated Ringer's before the ED. Explain how that changes the hourly rate for the first 8 hours, counting from his ED arrival at 0230. (d) What rate is the second half of the fluid given at? Show your work with the units. Why is the clock started at the time of the injury and not at his arrival?

Where to look in the EHR: Patient Summary (weight); Burn Surgery H&P (TBSA); Orders (lactated Ringer's); EMS Handoff Summary

1.3 Vital Sign Trend *(1.5 pts)*

Copy the vital signs at each time (he has an arterial line, so use the blood pressure shown). Circle every abnormal value. Then, in one or two sentences, describe the trend over the shift and say which value on the flowsheet you do NOT fully trust and why.

Where to look in the EHR: Flowsheets > Vital Signs

Vital sign	Mon 0700	Mon 1100	Mon 1500	Mon 1900
Temperature				
Heart rate				
Blood pressure				
Respiratory rate				
SpO2 (%)				
Pain (CPOT)				

Trend in one sentence:

1.3b Trend (scored with 1.3) *(0 pts)*

Describe the trend over the shift and name the value you do NOT fully trust and why.

1.4 The Pulse Oximeter Says 100% *(1.5 pts)*

Marcus's SpO2 reads 99 to 100% all morning. (a) Explain why this number can be falsely reassuring in this patient. (b) Which lab results show how much carbon monoxide is on his hemoglobin, and what were the values at 0250, 0415 and 0800? (c) What treatment lowers it, and what did the night team change at 0600 (read their notes)? (d) He smokes a pack a day: what does that tell you about the value he is heading toward?

Where to look in the EHR: Lab Results > Blood Gas (Carboxyhemoglobin, PaO2); Orders (ventilator); Flowsheets > Respiratory

1.5 Titrating the Fluids *(1.5 pts)*

Open the lactated Ringer's order, the MAR and the hourly urine output. (a) What is the urine output goal in mL/h and in mL/kg/h? (b) At 0930 the rate was changed: from what to what, and why? (c) Write the urine outputs for 1200-1300 and 1300-1400, say what the order tells you to do, and what the new rate becomes at 1400. (d) Name two things you check when you change the rate and one danger of giving too much fluid.

Where to look in the EHR: Orders > lactated Ringer's (burn resuscitation); MAR (rate changes); Flowsheets > Intake/Output

1.6 Calling the Burn Surgeon *(1.5 pts)*

It is 1400 and you have just seen the second low urine output. Write the SBAR you give Dr. Okafor on the phone. Use real numbers from the chart. End with what you are asking him to do and how you will confirm the order.

Where to look in the EHR: Flowsheets (vital signs, I&O, neurovascular); Lab Results (lactate, potassium, CK); Orders

1.7 Lines, Tubes and Airway *(1.5 pts)*

List SIX lines, tubes or devices Marcus has at 0700 (not counting the ventilator). For each, write the site and what you check every shift, and one complication you are watching for.

Where to look in the EHR: Avatar (IVs, drains and tubes); Flowsheets > Lines / Drains / Airways; Nursing Admission Note

Device and site	What you check or do every shift	A complication you watch for

1.8 The Ventilator and Sedation *(1.5 pts)*

Open Flowsheets > Respiratory at 0700. (a) Calculate his ideal body weight (male: 50 kg + 2.3 kg for every inch over 5 feet; 1 inch = 2.54 cm) and the tidal volume at 6 mL/kg. Does this match the set tidal volume? (b) List FOUR actions in the ventilator-associated pneumonia (VAP) bundle that you do this shift. (c) What is the RASS goal on Monday, and why is he sedated more deeply on the first day?

Where to look in the EHR: Flowsheets > Respiratory (vent settings, pressures); Orders (mechanical ventilation; sedation); Orders > Nursing

1.9 Reading the Labs *(1.5 pts)*

Open Lab Results and compare the first draws (about 0240-0250) with the 1200 and 1800 draws. Choose FOUR labs or lab groups that changed or matter. For each, write the values, why this happens in a burn patient, and what you do about it.

Where to look in the EHR: Lab Results (Chemistry, CBC, Blood Gas)

Lab and values (first draw to latest)	Why this happens in Marcus	What you do

1.10 Adding Up Your 12 Hours *(1.5 pts)*

Open Flowsheets > Intake/Output and add the hourly rows from 0700 to 1900 (12 rows). (a) What are his total intake, total output and net balance for your shift? (b) What was his average urine output in mL/h and in mL/kg/h? (c) Using the Parkland rates, how much lactated Ringer's should he have received BY 1900 counting from the injury (the EMS 500 mL and the ED 675 mL before the ICU count), and how much did he actually receive in all? (d) What does that tell you?

Where to look in the EHR: Flowsheets > Intake/Output; Orders (lactated Ringer's); EMS Handoff and ED notes

1.11 The 1400 Dressing Change *(1.5 pts)*

Read the Burn Wound Assessment note and the 1520 nursing note. (a) Why was hydromorphone given at 1345 and what tool measures pain in an intubated, sedated patient (name its four parts)? (b) Which topical drugs were applied and where? (c) What do you assess at every dressing change? (d) Name two ways you protect him and yourself from infection.

Where to look in the EHR: Chart Review > Notes (Burn Wound Assessment; Nursing Note 1520); MAR (hydromorphone, silver sulfadiazine, bacitracin)

1.12 Handoff at 1900 *(2 pts)*

It is 1850. Write your SBAR handoff for E. Haddad, RN, the night nurse. Use real numbers and name what the night nurse must watch for and do in the first part of the night, including anything coming up in the next few hours.

Where to look in the EHR: Everything you have charted and read this shift; Orders; Lab Results; MAR; Flowsheets
